### 1 Quick Guide

To create an argumentation framework in your LATEX-document, you first have to import the argumentation package in the preamble:

```
\usepackage{argumentation}
```

You can then create a new af environment in which the argumentation framework can then be built:

You may want to wrap the **af** environment in a **figure** environment in order to add a caption and reference label. You can add a label inside the **af** environment via  $\label{\langle label \rangle}$ . Anywhere in your document, you can then reference the af with  $\ref{\langle label \rangle}$ .

Inside the af environment, you can then add an argument as follows:

```
\langle name \rangle
```

Here,  $\langle name \rangle$  is the name of the argument displayed in the graph and the argument is automatically assigned an *identifier* of the form:  $a1, a2, \ldots$ 

To properly add further arguments, you also need to specify a position. The argumentation package offers two easy ways of doing that:

```
\label{eq:argument} $$ \operatorname{argId}_{\sigma}= (argId) = (name) $$ \arg (\langle posX \rangle, \langle posY \rangle) $$
```

The first instance is *relative positioning* where  $\langle dir \rangle$  is the direction of placement relative to the argument with the identifier  $\langle argId \rangle$ , with  $\langle dir \rangle$  typically being one of: right, left, above, below.

The second instance is *absolute positioning* where  $(\langle pos X \rangle, \langle pos Y \rangle)$  is a set of coordinates, for example something like (2, 0), (0, -2) or (-1, 3.5).

The next step is adding attacks. For that you can simply use the following command:

```
\attack{\langle a1 \rangle}{\langle a2 \rangle}
```

Substitute  $\langle a1 \rangle$  and  $\langle a2 \rangle$  with the identifier of the two arguments. Alternatively, you can also directly create bidirectional attacks and self-attacks with the following two commands:

```
\displaystyle \frac{\langle a1 \rangle}{\langle a2 \rangle}
 \displaystyle \frac{\langle a1 \rangle}{\langle a2 \rangle}
```

To customize the look of the arguments and attacks and for a detailed overview over all options and commands provided by this package, please refer to the following example or to the full documentation in Section 3.

### 2 Example Usage

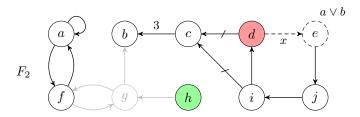

Figure 1: The AF  $F_2$  created with the argumentation package.

```
\usepackage[namestyle=math]{argumentation}
\begin{document}
\begin{figure}[ht]
    \centering
   \begin{af}
       \argument{a}
       \argument[right=of a1]{b}
       \argument[right=of a2]{c}
       \argument[rejected,right=of a3]{d}
       \argument[right=of a4,incomplete]{e}
       \argument[below=of a1]{f}
       \argument[inactive,right=of a6]{g}
       \argument[accepted,right=of a7]{h}
       \argument[right=of a8]{i}
       \argument[right=of a9]{j}
       \alpha {\$F_{\colored{faf:ex2}}} at (-1,-1)
       \selfattack{a1}
       \dualattack{a1}{a6}
       \dualattack[inactive]{a6}{a7}
       \attack[inactive]{a8}{a7}
       \attack[inactive]{a7}{a2}
       \attack{a5}{a10}
       \attack{a10}{a9}
       \attack{a9}{a4}
       \annotatedattack[above]{a3}{a2}{$3$}
       \annotatedattack[below,incomplete]{a4}{a5}{$x$}
       \support{a4}{a3}
       \support{a9}{a3}
       \label{af:ex2}
   \end{af}
   \caption{The AF $F_{\ref{af:ex2}}$ created with the \argumentation package.}
   \label{fig:example}
\end{figure}
. . .
\end{document}
```

# 3 Documentation for Version 1.4 [2024/10/31]

The argumentation package provides an easy way for creating argumentation frameworks in LaTeX-documents. It builds on the TikZ package for drawing the argumentation graphs. The argumentation package provides simplified syntax while keeping the same customisation options and keeping full compatibility with all TikZ features. In addition to that, the argumentation package provides the ability to label and reference the created argumentation frameworks as well as some other additional features.

The argumentation package can be imported via the command

```
\usepackage[\langle options \rangle] \langle argumentation \rangle
```

In the following, we give an overview over the functionality of the argumentation package. Most importantly, that includes the af environment to encapsulate the created argumentation frameworks, the command \argument{} to create argument nodes and the attack{} {} command to create attack edges. Options to customise the appearance of arguments and attacks are described in Section 4.

#### 3.1 The af Environment

The argumentation package provides an environment for creating argumentation frameworks in LATEX-documents.

```
\begin{af} [\langle options \rangle] \\ \langle environment \ contents \rangle \\ \end{af}
```

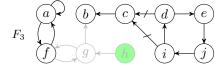

The af environment supports referencing. For that add the command  $\label{\langle label \rangle}$  anywhere inside an af environment. The AFs are automatically numbered in ascending order of occurrence. The  $\langle label \rangle$  allows you to reference the corresponding AF via  $\ref{\langle label \rangle}$  anywhere in the document.

If you want to create an AF that is excluded from the automatic numbering, the argumentation package provides the af\* version of the environment, which has the same functionality otherwise:

```
\begin{af*} [\langle options \rangle] \\ \langle environment \ contents \rangle \\ \end{af*}
```

The af (and af\*) environment also accepts the package style options (see Section 4). Locally set style options override defaults and the values set globally with the package import.

In general, the **af** environment extends the **tikzpicture** environment, meaning all TikZ commands and parameters can be used for the **af** environment. The **argumentation** package also provides the options small or tiny for the **af** environment to create smaller AFs. This is especially useful for two-column layout documents.

- (a) An AF created with the small option set.
- (b) An AF created with the tiny option set.

Figure 2: Argumentation frameworks using the small and tiny option of the af environment.

<sup>&</sup>lt;sup>1</sup>Dung, P. M. (1995). On the acceptability of arguments and its fundamental role in non-monotonic reasoning, logic programming and n-person games. Artificial intelligence.

#### 3.2 Creating Arguments

```
\argument [⟨options⟩] (⟨id⟩) {⟨name⟩} at (⟨posX⟩,⟨posY⟩)

⟨options⟩ (optional) a list of TikZ style parameters and/or relative positioning information.

⟨id⟩ (optional) the identifier of the new argument. Per default, when omitted, arguments will automatically be assigned an identifier of the form: a1, a2, a3, ....

⟨name⟩ the displayed name of the argument.

⟨posX⟩,⟨posY⟩ (optional) the coordinates where the argument is placed. Must be omitted if relative positioning is used.
```

#### 3.2.1 Positioning

TODO: rewrite Placement of argument nodes with the argumentation package relies on relative placement via the TikZ-library positioning. The relative positioning information is provided as an optional parameter as follows

```
\argument[\langle dir \rangle = of \langle argId \rangle] \{\langle name \rangle\}
```

Additionally, you can adjust the horizontal/vertical position of an argument via the options  $xshift=\langle v \rangle$  and  $yshift=\langle v \rangle$ . The value  $\langle v \rangle$  is the horizontal/vertical offset, e.g., -6.6ex or 1cm.

Example 1 TODO: Example for creating arguments with different positioning

TODO: where to put this?

#### 3.2.2 Additional Argument Styling

Furthermore, you can provide optional parameters to adjust the style of the argument node. For that you can use all TikZ-style options and additionally the following predefined style parameters (Refer to Appendix ?? for a detailed description of these parameters):

```
inactive The argument is displayed with grey outline and text.

Incomplete The argument is displayed with a dotted outline.

Invisible The argument node is completely transparent.

In accepted The argument is displayed with green background color.

In argument is displayed with red background color.

In argument is displayed with cyan background color.

In argument is displayed with yellow background color.
```

#### 3.3 Creating Attacks

```
\attack [\langle options \rangle] {\langle argId1 \rangle} {\langle argId2 \rangle}
\langle arg1 \rangle Identifier of the attacking argument.
\langle arg2 \rangle Identifier of the attacked argument.
\dualattack [\langle options \rangle] {\langle argId1 \rangle} {\langle argId2 \rangle}
\langle arg1 \rangle Identifier of the first argument.
```

```
(arg2) Identifier of the second argument.
\ \left( \left( options \right) \right) = \left( \left( argId \right) \right)
         (arg1) Identifier of the self-attacking argument.
\annotatedattack [\langle options \rangle] \{\langle argId1 \rangle\} \{\langle argId2 \rangle\} \{\langle value \rangle\}
         (options) TODO: fixSpecifies where the annotation should be placed relative to the attack
               arrow and should be one of: above, below, left, right.
         (arg1) Identifier of the attacking argument.
         (arg2) Identifier of the attacked argument.
         (value) The text that is annotated.
\support [\langle options \rangle] \{\langle argId1 \rangle\} \{\langle argId2 \rangle\}
         (arg1) Identifier of the supporting argument.
         (arg2) Identifier of the supported argument.
           TODO: where to put this? To customize an attack you can provide additional optional
        parameters:
                    inactive The attack is displayed in grey.
                 incomplete
                             The attack is displayed with a dotted line.
                    invisible
                              The attack is completely transparent.
                  selfattack Use if source and target of the attack are the same node.
                  bend right The attack arrow is bent to the right.
                               Can additionally provide the angle, e.g., bend right=40.
                   bend left The attack arrow is bent to the left. Can also provide an angle.
            Example 2 TODO: Example for creating attacks (and other edges)
```

#### 3.4 Beamer

```
\label{eq:continuous} $$ \left( \left( \frac{af-label}{af-label} \right) \left( \frac{list}{argument list} \right) \right) $$ \left( \frac{af-label}{argument list} \right) $$ \left( \frac{af-label}{argument list} \right) $$ \left( \frac{af-label}{argument list} \right) $$
```

**Example 3** TODO: Example of all four beamer functions

#### 3.5 Other Commands

#### Example 4 TODO: Example of the other commands

#### 3.5.1 Argumentation Macros

TODO: rewrite Additionally, the following commands are provided to facilitate referencing argumentation frameworks. To activate them, add the parameter macros=true when loading the package. Most importantly the command \afref{\name}} which works like the ref command but adds the reference number directly into the index of the \AF symbol. You may redefine any of the first four commands if you prefer a different naming scheme for AFs.

\AF	F
\arguments	A
\attacks	R
\AFcomplete	F = (A, R)
\afref{af:ex1}	$F_1$
\fullafref{af:ex1}	$F_1 = (A_1, R_1)$

Table 1: Provided macros and their respective output.

# 4 Package Options

The argumentation package comes with some package options to customize the appearance of the created argumentation frameworks as well as some additional features. All style package options can both be set globally when importing the package and also locally for each af environment. To import the argumentation package, use the following command in the preamble of your LATEX-document:

```
\usepackage[\langle options \rangle] \{argumentation\}
```

The following package options are currently available:

- **argumentstyle** (default standard) Globally sets the appearance of the argument nodes. The argumentation package provides five options: standard, large, thick, gray and colored. Detailed descriptions of these options can be found below.
- attackstyle (default standard) Globally sets the appearance of the attack edges. The package comes with three available options: standard, large and modern. Detailed descriptions of these options can be found below.
- **supportstyle** (default standard) Globally sets the appearance of the support edges. The package comes with three available options: standard, dashed and double. Detailed descriptions of these options can be found below.
- namestyle (default none) Sets the text formatting applied to the argument names in the document. The package comes with five available options: none, math, bold, monospace and monoemph. Detailed descriptions of these options can be found below.
- indexing (default numeric) Enables or disables automatic generation of TikZ node-IDs for the created arguments. The available options are: none, numeric and alphabetic. Under the default numeric indexing the generated argument IDs are of the form  $a1, a2, \ldots$ . With alphabetic indexing the IDs will simply be letters:  $a, b, \ldots$  If none is selected, no IDs will be generated and you are required to provide them for each argument via the parameter ( $\langle id \rangle$ ) of the \argument command.
- macros Boolean (default false) When enabled provides additional macros for naming and referencing argumentation frameworks (see Table 1).
- **beamer** Boolean (default false) When enabled, provides the commands for recreating argumentations frameworks described in Section 3.4.

In the following we give an overview of the different options for the style parameters that can be used to customise the created argumentation frameworks. For the exact definitions of these parameters, refer to Section 5.

#### $argumentstyle = \langle option \rangle$

standard Circular argument node with normal size argument name.

large Larger font of the argument name.

thick Thick black outline and normal size argument name.

gray Thick gray outline, light gray background.

colored Thick blue outline, light blue background.

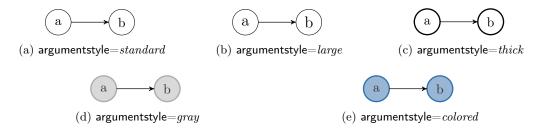

Figure 3: Available options for argumentstyle.

#### attackstyle=\langle option \rangle

standard 'stealth' TikZ arrow tip.

large Arrow tip is larger and sharper.

modern TikZ ModernCS arrow tip.

Figure 4: Available options for attackstyle.

#### $supportstyle = \langle option \rangle$

standard Same tip as attack arrow, perpendicular mark on arrow line.

dashed Dashed arrow line and same tip as attack arrow.

double Double arrow line and large flat tip.

Figure 5: Available options for supportstyle. Note that for *standard* and *dashed* the arrow tip of the selected attackstyle will be used.

#### $namestyle = \langle option \rangle$

none No effect applied to argument name.

math  $\,$  The argument name is rendered as math text.

(name must be given without mathmode).

bold The argument name is rendered in **bold**.

(name must be given without mathmode).

monospace The argument name is rendered in monospace font.

(name must be given without mathmode).

monoemph The argument name is rendered as name.

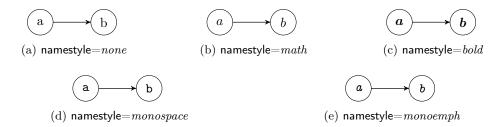

Figure 6: Available options for namestyle. You can of course apply any formatting yourself when using the default namestyle=none.

# 5 Style Parameter Reference

For reference, the style parameters provided by this package are listed below. You may use or redefine them at your own discretion.

TikZ-keyword	style parameters	
argument size argument argument standard argument large argument thick argument gray argument colored	contains the currently selected argument size contains the currently selected argument style and size circle,inner sep=0,outer sep=0,draw=black circle,inner sep=0,outer sep=0,draw=black,font=\large circle,inner sep=0,outer sep=0,draw=black,line width=0.1em argument thick,fill=gray!30,draw=gray!65,text=black!80 argument thick,fill=aigblue!40,draw=aigblue!80,text=black!80	
attack attack standard attack large attack modern selfattack	<pre>contains the currently selected attack style -{stealth'} -{Stealth[scale=1.25]} -{To[sharp,length=0.65ex,line width=0.05em]} loop,min distance=0.4em,in=0,out=60,looseness=4.5</pre>	
support support standard support dashed support double	contains the currently selected support style attack,postaction={decorate,decoration={}} attack,densely dashed -{Classical TikZ Rightarrow},double	
inactive incomplete accepted rejected undecided highlight invisible	fill=none,draw=gray!50,text=gray!60 densely dashed fill=green!40 fill=red!40 fill=cyan!40 fill=aigyellow!60 draw=none,text=black!0,fill=none	
standard small tiny	node distance=6.6ex,argument size/.style=minimum size=4.5ex, attack width/.style=line width=0.05em node distance=3.5ex,argument size/.style=minimum size=3.4ex, attack width/.style=line width=0.045em node distance=2.3ex,argument size/.style=minimum size=2.6ex, attack width/.style=line width=0.03em,font=\small	

Table 2: Reference list of TikZ-style parameters provided by the argumentation package.

### 6 Version History

### [v1.4 2024/10/31]

- Added functions \aflabeling, \afextension, \afreduct and \afrestriction that recreate (parts of) previously created argumentation frameworks. Can be enabled via the package option beamer=true.
- Added internal storage of arguments and attacks of an argumentation framework to enable further computations.
- Added environment af\* for argumentation frameworks that are unlabeled/uncounted.
- Added command \setargumentcolorscheme{ }{ } to change color scheme of the colored argument style.
- Added command \setafstyle{ } to set global style options for the AFs.
- Added optional parameter (\(\frac{value}{\)}\) to \attack command to add a label to the attack edge (undocumented for now).
- Major revision of the documentation.
- Various minor changes to internal functions, naming scheme and comments.

#### [v1.3 2024/09/25]

- Added support for \label{ } and \ref{ } to af environment.
- Added commands \AF, \arguments, \attacks and \AFcomplete to facilitate consistent naming of AFs. Have to be loaded with the package option macros=true.
- Added commands \afref{ } and \fullafref{ } to reference AFs.
- adjusted scaling of nodes and arrows for larger page sizes.
- added new style options for arguments.
- Various minor fixes and changes regarding the namestyle package option.

#### [v1.2 2024/06/07]

- Changed Syntax of \argument command. The *id* parameter is now given inside parenthesis instead of curly braces and is optional.
- Added absolute positioning to \argument command, like for TikZ nodes.
- Added package option indexing to toggle automatic generation of identifiers for created argument nodes. Can be set to *none*, or selected between *alphabetic* and *numeric* (default).
- All package style options can now also be set locally in the af environment.
- Adjusted \annotatedattack to require position parameter.
- Various minor bugfixes regarding the namestyle package option.
- Added new argumentstyle large.

# [v1.1 2023/12/03]

- $\bullet\,$  Adjusted standard styles.
- $\bullet$  Added command for creating annotated attacks.
- Now only provides one environment, which can be parameterised.
- Changed option management to pgfkeys.
- Updated and improved documentation.

# [v1.0 2023/11/05]

• First Version.
